

Total Proteins Identified per Sample

Sample

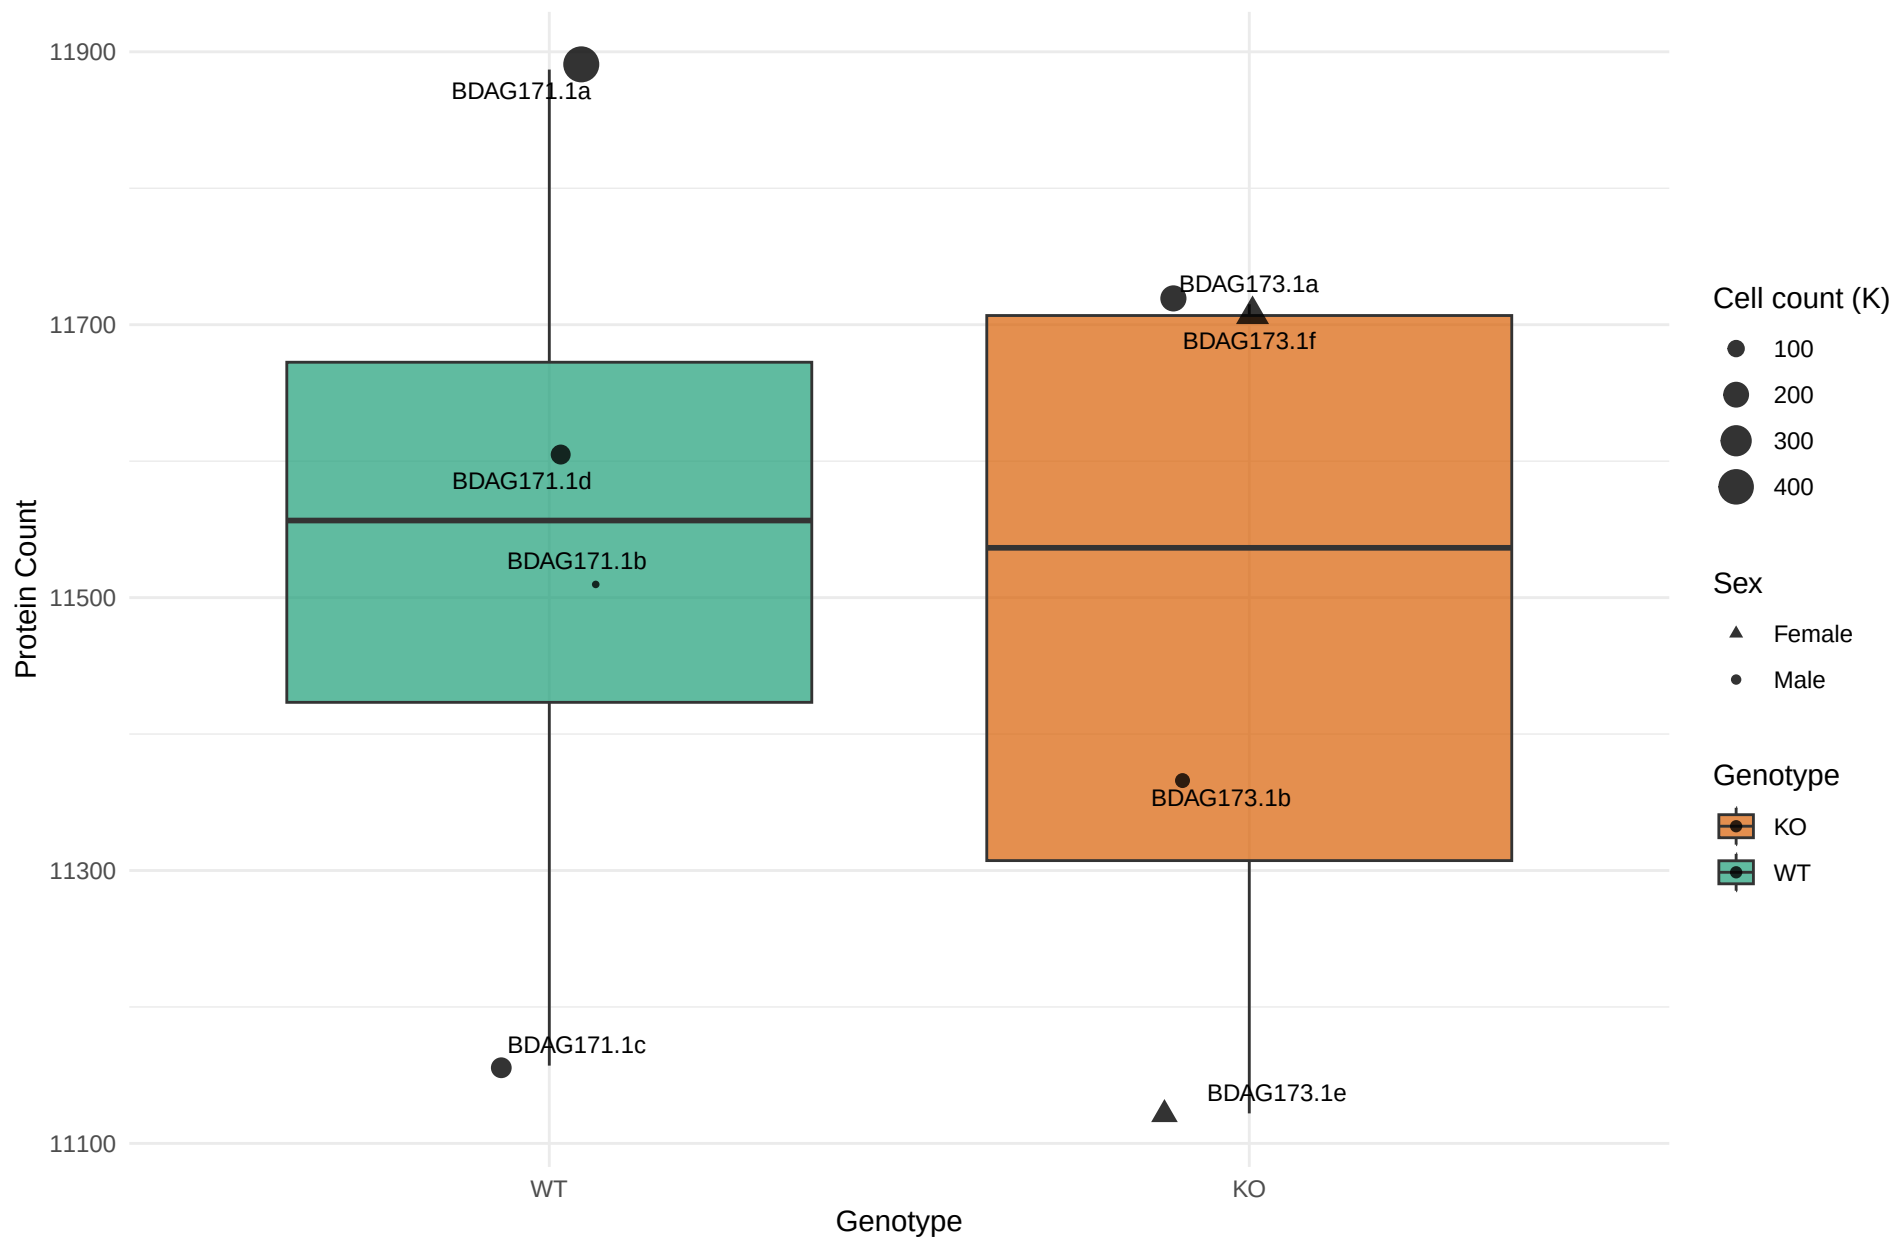

% Missing Values per Sample

% of the total protein pool absent in each sample

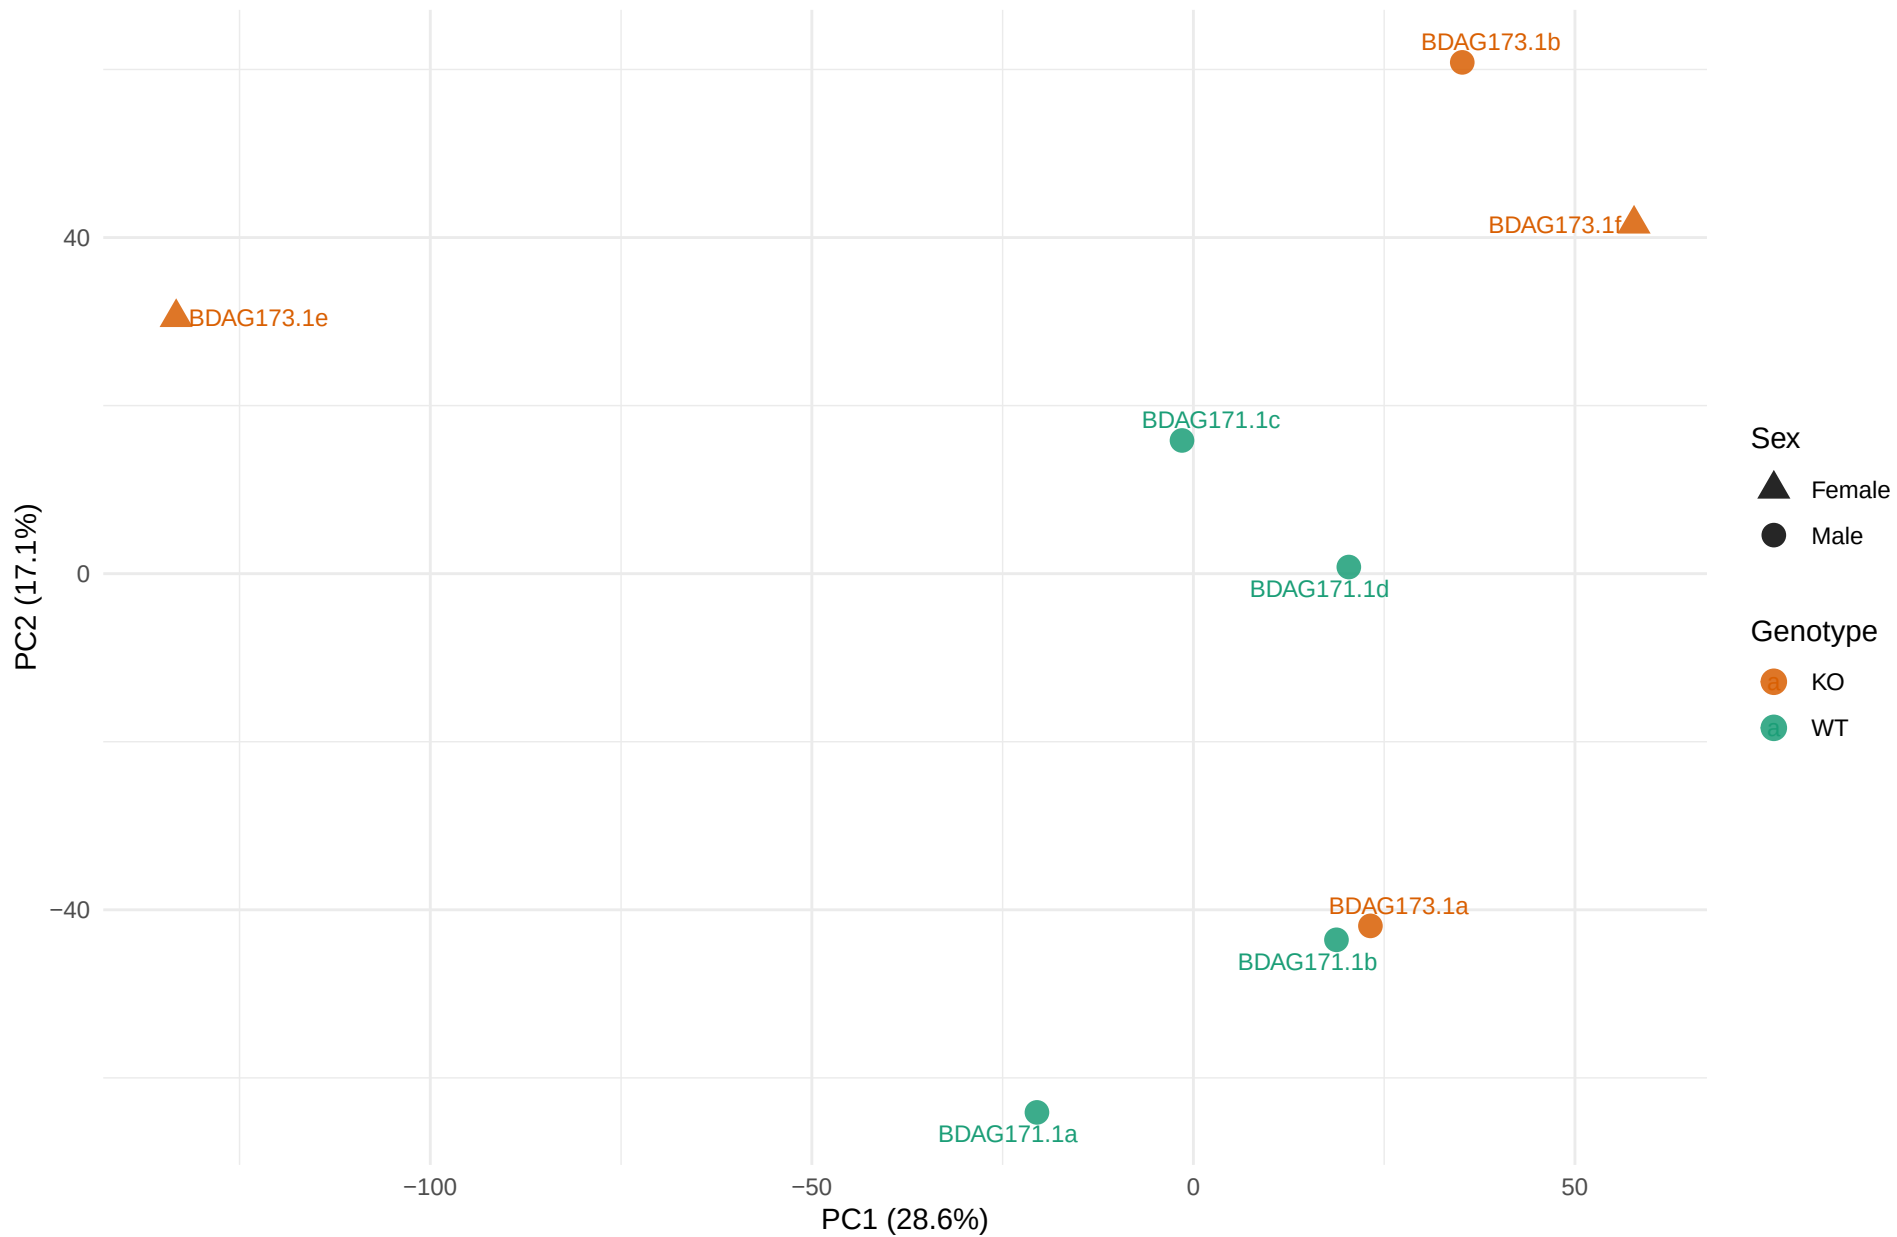

Protein Yield by Genotype

Point size = cell count (thousands); shape = sex

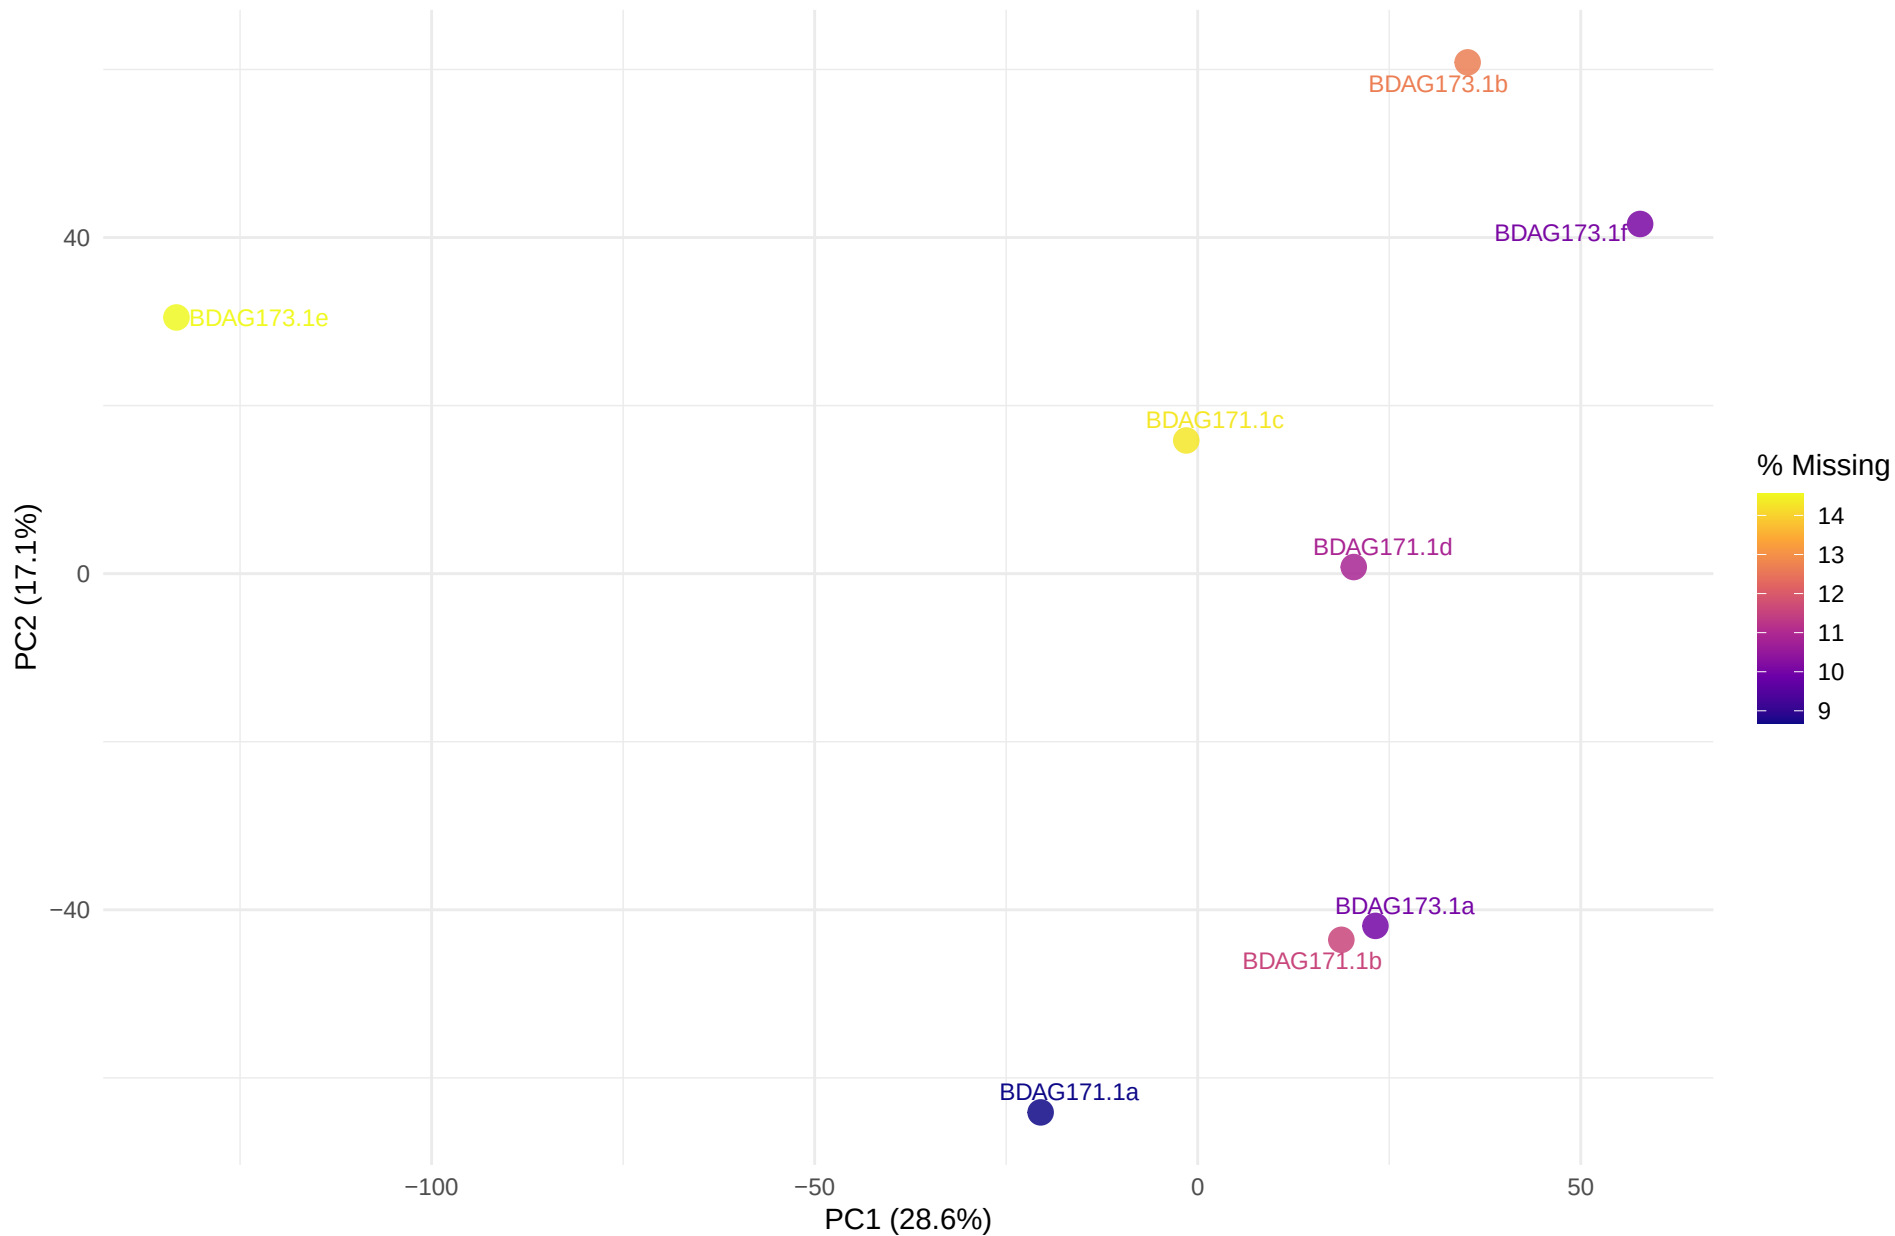

PCA of Log2 Protein Intensities

Color = SORL1 genotype; shape = sex

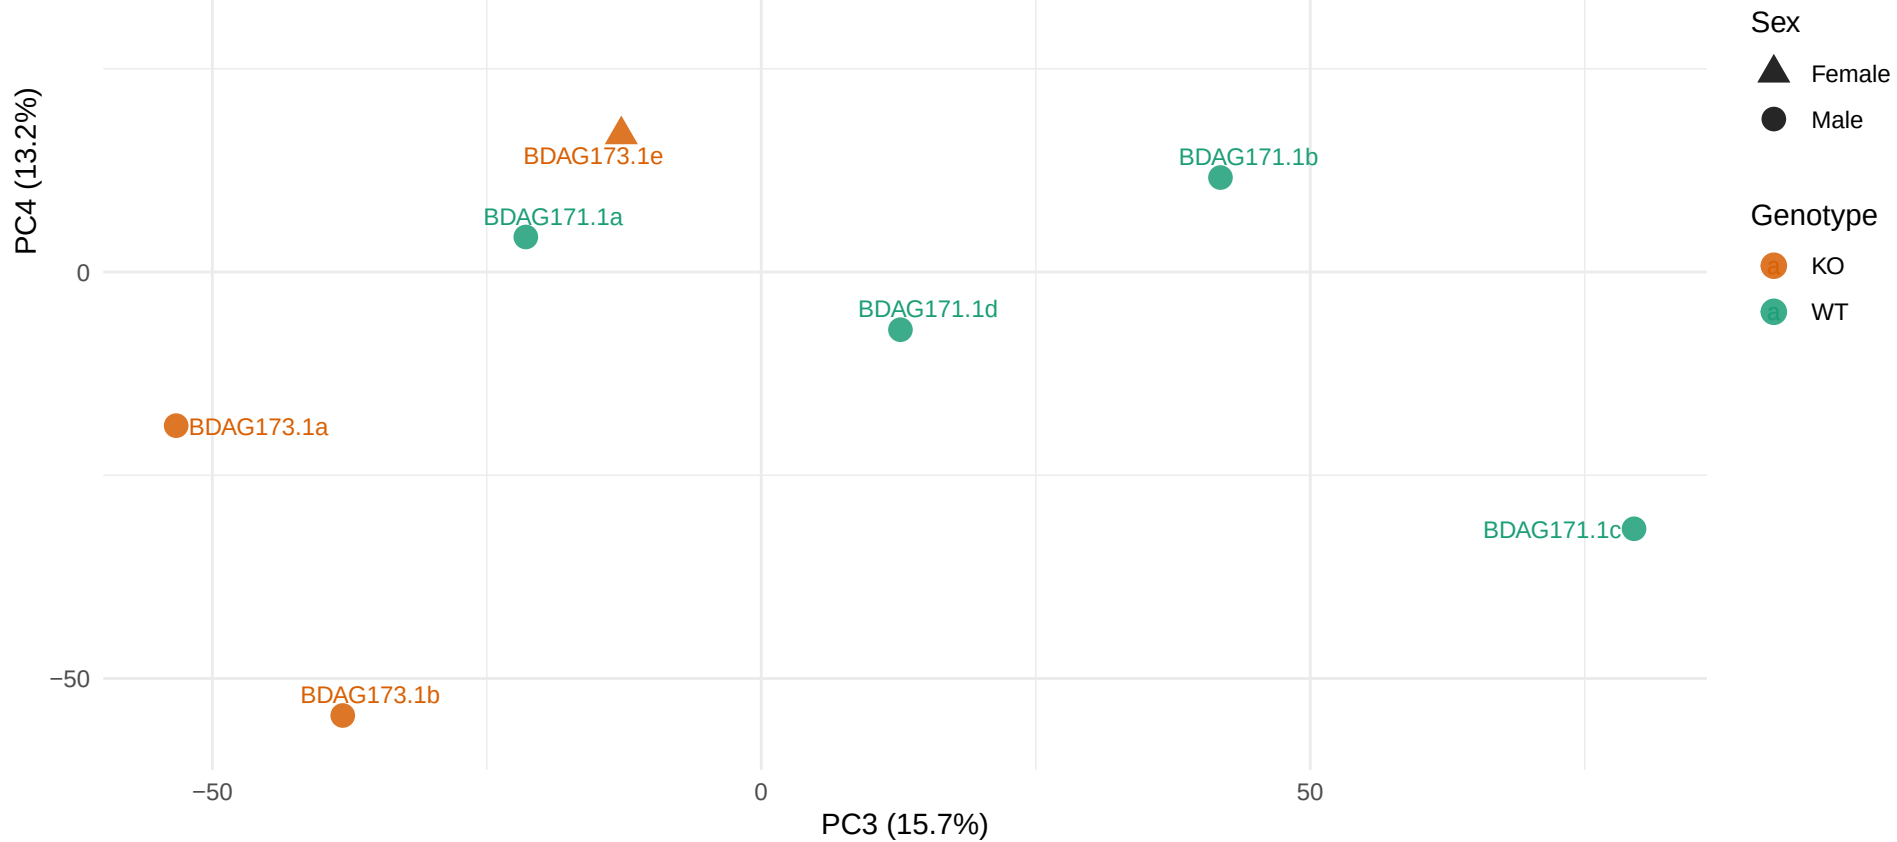

PCA coloured by % Missing

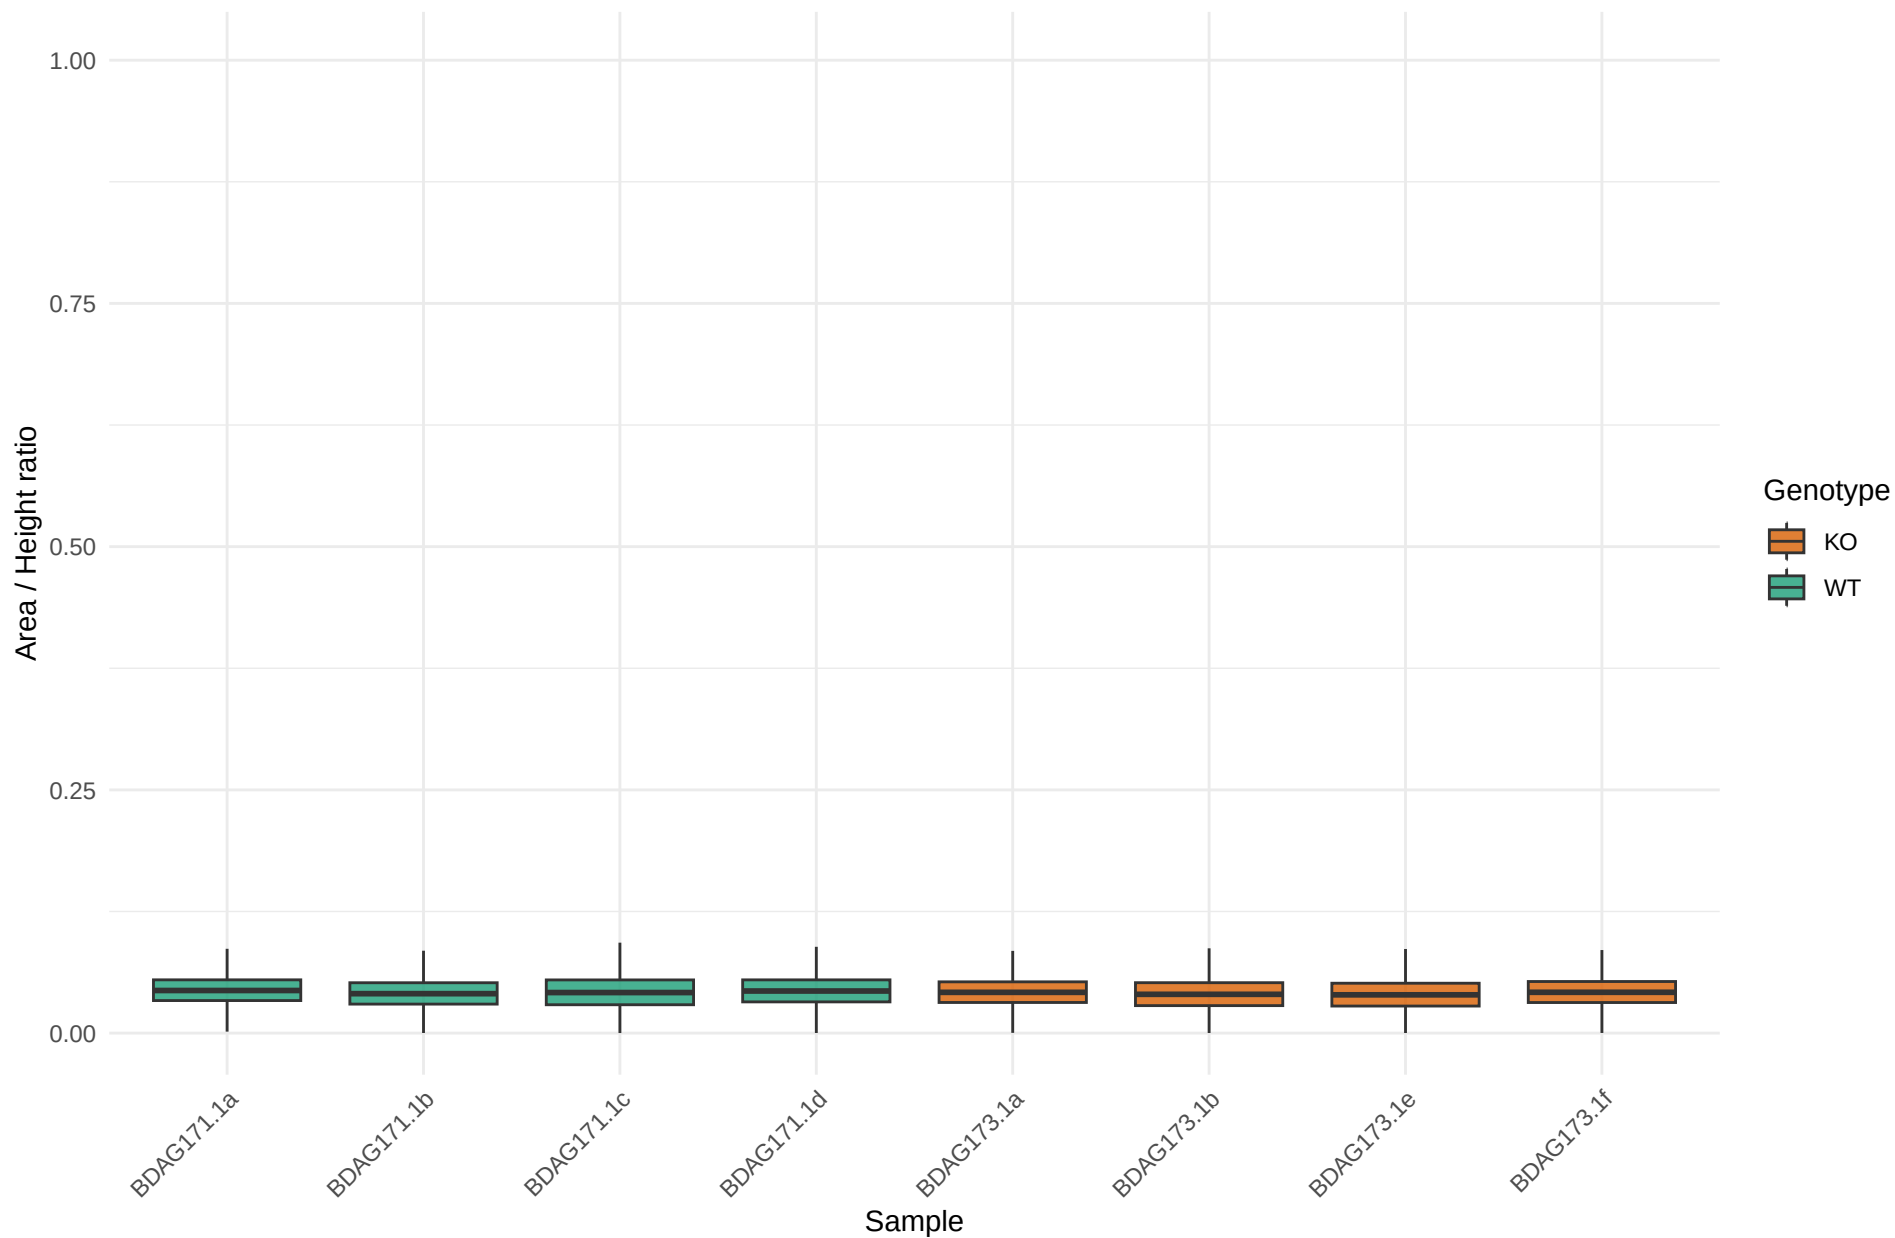

If a weak sample drives a PC, it should be removed before MSstats

PCA – PC3 vs PC4

Peak Width Proxy per Sample (NormalisedArea / NormalisedHeight)
Higher = broader peaks. Proper FWHM requires re-export with EG.FWHM column.

Median Peak Width Proxy $\pm$ IQR

Samples far above the group median have broader / lower-quality peaks
